

**Example 7b-4:** Use the conjugate beam method to determine the slope at point  $B$  and the displacement at  $x = L/2$ . Assume that  $EI$  is constant.

$$\begin{aligned} \sum M_B = 0 &= -M_0 - V_A L & V_A &= -\frac{M_0}{L} \\ \sum F_y = 0 &= V_A - V_B & V_B &= V_A = -\frac{M_0}{L} \end{aligned}$$

$$\sum M_A = 0 = Fd - V_B(L) \quad V_B = \frac{Fd}{L}$$

CONJUGATE BEAM

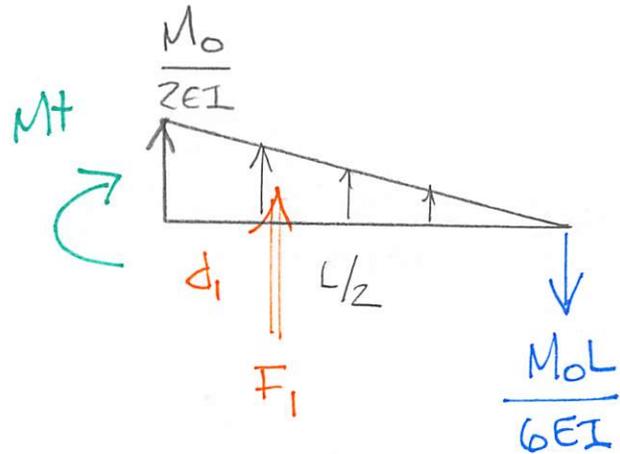

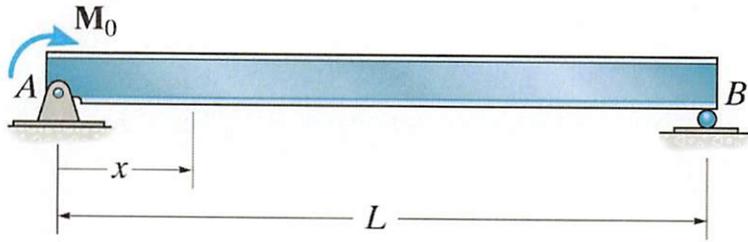

$$\underline{\underline{V_B = \frac{M_0 L}{6EI}}}$$

$$F = \frac{1}{2}(L) \frac{M_0}{EI} = \frac{M_0 L}{2EI} \quad d = \frac{1}{3}L$$

**Example 7b-4:** Use the conjugate beam method to determine the slope at point  $B$  and the displacement at  $x = L/2$ . Assume that  $EI$  is constant.

2/2

$$\sum M_{cut} = 0 = -M + F_1 d_1 - \frac{M_0 L}{6EI} (L/2)$$

$$M = \frac{M_0 L^2}{48EI} - \frac{M_0 L^2}{12EI} = -\frac{3M_0 L^2}{48EI}$$

$$= -\frac{M_0 L^2}{16EI}$$

$$F_1 = \frac{1}{2} (L/2) \frac{M_0}{2EI} = \frac{M_0 L}{8EI}$$

$$d_1 = \frac{1}{3} (L/2) = \frac{L}{6}$$
